Brain Computer Interface

A Brain-Computer Interface (BCI) provides a new communication channel between the human brain and the computer. The 100 billion neurons communicate via minute electrochemical impulses, shifting patterns sparking like fireflies on a summer evening, that produce movement, expression, words. Mental activity leads to changes of electrophysiological signals.

The BCI system detects such changes and transforms it into a control signal. In the case of cursor control, for example, the signal is transmitted directly from the brain to the mechanism directing the cursor, rather than taking the normal route through the body's neuromuscular system from the brain to the finger on a mouse.

By reading signals from an array of neurons and using computer chips and programs to translate the signals into action, BCI can enable a person suffering from paralysis to write a book or control a motorized wheelchair or prosthetic limb through thought alone. Many physiological disorders such as Amyotrophic Lateral Sclerosis (ALS) or injuries such as high-level spinal cord injury can disrupt the communication path between the brain and the body. This is where brain computer interface comes into play contributing for beneficial real time services and applications.

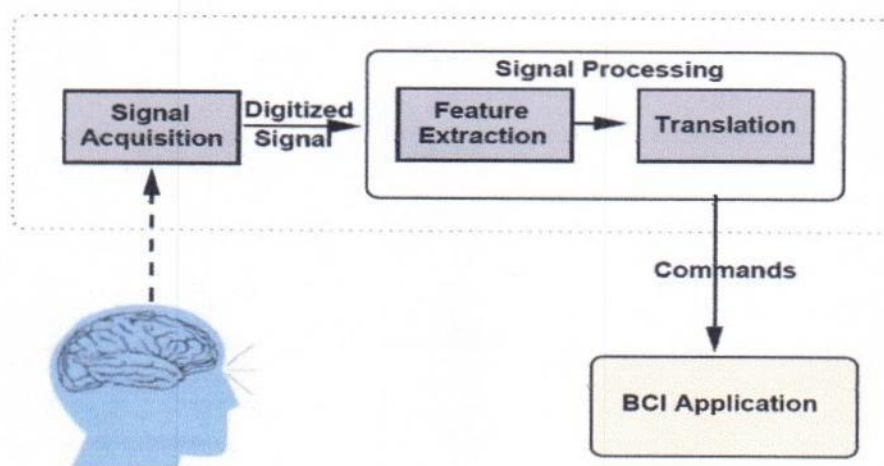

What is Brain Computer Interface?

The Wonder Machine – Human Brain

The reason a BCI works at all is because of the way our brains function. Our brains are filled with neurons, individual nerve cells connected to one another by dendrites and axons. Every time we think, move, feel or remember something, our neurons are at work. That work is carried out by small electric signals that zip from neuron to neuron as fast as 250 mph. The signals are generated by differences in electric potential carried by ions on the membrane of each neuron.

Although the paths the signals take are insulated by something called myelin, some of the electric signal escapes. Scientists can detect those signals, interpret what they mean and use them to direct a device of some kind. It can also work the other way around.

For example, researchers could figure out what signals are sent to the brain by the optic nerve when someone sees the color red. They could rig a camera that would send those exact signals into someone's brain whenever the camera saw red, allowing a blind person to "see" without eyes.

Basic block diagram of a BCI system incorporating signal detection, processing and deployment

TRAINING OUTCOMES:

- Students know how computer interface with mind.
- Students know architecture of BCI.
- How BCI System is controlling human brain
- Students know uses of BCI System:
 - allow paralyzed people to control prosthetic limbs with their mind
 - transmit visual images to the mind of a blind person, allowing them to see
 - transmit auditory data to the mind of a deaf person, allowing them to hear
 - allow gamers to control video games with their minds
 - allow a mute person to have their thoughts displayed and spoken by a computer

DEVOPS

DevOps is the process of incorporating the culture and also a set of practices to achieve faster delivery, agility, improve security, quicker automation, and serve better. And Agile Methodology involves a continuous iteration of development and testing in the SDLC process.

Azure Boards – A work tracking system with Kanban boards, dashboards, and reporting

Azure Pipelines – A CI/CD, testing, and deployment system that can connect to any Git repository

Azure Repos – A cloud-hosted private Git repository service

Azure Test Plans – A solution for tests and capturing data about defects

Azure Artifacts – A hosting facility for Maven, npm, and NuGet packages

TRAINING OUTCOMES:

- Plan & Track Work
- Azure Cloud-hosted Services
- How students Access to New Features
- Integrated Collaboration Services
- Reliability, Flexibility and Dashboard Control
- Support for Manual and Exploratory Testing

SRI INDU INSTITUTE OF ENGINEERING AND TECHNOLOGY

Accredited by NAAC with A+ Grade, Recognized under 2(f) of UGC Act 1956.
